

SL384XG

Green Mode PWM Controller

Features

- Green Mode to Support Blue Angel requirement.
- Low start-up current (50uA typical)
- Low operating current 6mA
- Low standby power 0.5W
- Pin-for-pin compatible with UC384X
- Current Mode operation up to 500 KHz
- Under voltage lock out (UVLO)

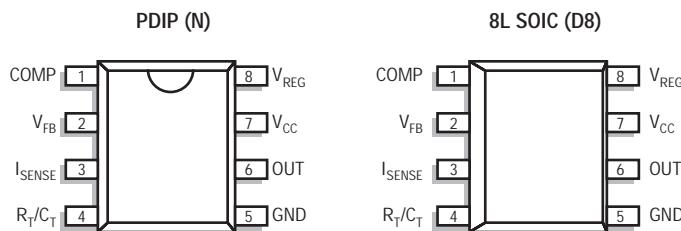

Description

The SL3842G family of control ICs are Green Mode PWM Controller and are pin-for-pin replacement of the industry standard UC3842 series of devices. The high output current drive capability of 1A combined with low start-up current make it an ideal PWM Controller where high efficiency is required. The circuit is more completely specified to guarantee all parameters impacting power supply manufacturing tolerances.

Applications

- Off-line Converters
- DC-DC Converters
- DVD/STB Power Supply
- Power Adapter
- CRT Monitoring Power Supply

Ordering Information

Circuit Type: SL384XG D8 13
Current Mode Controller (See Table A)

Package Style _____
D8 = 8 Pin Plastic SOIC
N = 8 Pin Plastic DIP

Packaging Option:
T = Tube
13 = Tape and Reel (13" Reel Dia)

Pin Function Description

Pin Number	Function	Description
1	COMP	This pin is the error amplifier output. Typically used to provide loop compensation to maintain V _{FB} at 2.5 V.
2	V _{FB}	Inverting input of the error amplifier. The non-inverting input is a trimmed 2.5 V bandgap reference.
3	Current Sense	A voltage proportional to inductor current is connected to the input. The PWM uses this information to terminate the gate drive of the output.
4	R _T /C _T	Oscillator frequency and maximum output duty cycle are set by connecting a resistor (R _T) to V _{REG} and a capacitor (C _T) to ground. Pulling this pin to ground or to V _{REG} will accomplish a synchronization function.
5	GND	Circuit common ground, power ground, and IC substrate.
6	Output	This output is designed to directly drive a power MOSFET switch. This output can sink or source peak currents up to 1A. The output for the SL3844/5G switches at one-half the oscillator frequency.
7	V _{CC}	Positive supply voltage for the IC.
8	V _{REG}	This 5 V regulated output provides charging current for the capacitor C _T through the resistor R _T .

Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit
Supply Voltage ($I_{CC} < 30$ mA)	V_{CC}	Self-Limiting	V
Supply Voltage (Low Impedance Source)	V_{CC}	30	V
Output Current	I_{OUT}	± 1	A
Output Energy (Capacitive Load)		5	μJ
Analog Inputs (Pin 2, Pin 3)		-0.3 to 6.3	V
Error Amp Sink Current		20	mA
Maximum Power Dissipation	P_D		
	8L SOIC	460 mW	
	8L PDIP	1000 mW	
Maximum Junction Temperature	T_J	150	$^{\circ}C$
Operating Temperature		-40 to 85	$^{\circ}C$
Storage Temperature Range	T_{STG}	-65 to 150	$^{\circ}C$
Lead Temperature, Soldering 10 Seconds	T_L	+300	$^{\circ}C$

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

1. This parameter is not 100% tested in production.
2. Parameter measured at trip point of PWM latch.
3. Transfer gain is the relationship between current sense input and corresponding error amplifier output at the PWM latch trip point and is mathematically expressed as follows:

$$A = \frac{\Delta I_{COMP}}{\Delta V_{SENSE}} ; -0.2 \leq V_{SENSE} \leq 0.8 \text{ V}$$

4. At the over-temperature threshold, T_{OT} , the oscillator is disabled. The 5 V reference and the PWM stages, including the PWM latch, remain powered.
